Tutorial Proposal
Form Open on Modal Button Click

For my tutorial, I plan on using a modal button that when clicked, opens a form that the user can pass information into. The following is what each button will do:

- First Modal Button:
    - Allows user to subscribe to email list
    - Button click opens form that lets user input their first and last name along with their email address
    - Validates the first and last name using a name validation function, then validates email using an email validate function
    - For now, saves a .txt file to the user's computer containing the information inputted into the form
        - The goal is to save this information to a folder in the website files, I plan on trying to get this figured out in lab
    - Then pops up an alert at the top of the screen saying that this information has been added to the email list

- Second Module Button
    - Allows user to send a message to the website host, containing their name, email, and message they would like to send
    - Validates the email and name on submission of form
    - Saves a .txt file with the user's information and their message into a folder in the website's files
    - Pop up an alert saying message has been sent
    - Cannot make second button work yet until I make my functions reusable
